Business Logic & Definitions

Sign convention
In the ledger, debits are positive and credits are negative, so income is stored as a negative number. The measures flip income lines (revenue, other income, finance income) so the statements read the usual way.

Data model
Current-year detail (Fact_Financials) sits at account, business unit and cost-centre level. The financial pack (Fact_Benchmark) holds statement totals for both years. They are kept side by side with no relationship, because the pack has no account or cost-centre field to join on.

Reconciliation
Revenue, gross profit, operating profit, PAT and EBITDA are rebuilt from the ledger lines and compared with the pack. All five differences are zero, so the two sources agree.
